Mathematical Statistics  
with Applications in R,  
Second Edition, offers a  
modern calculus-based  
theoretical introduction to

mathematical statistics  
and applications. The  
book covers many  
modern statistical  
computational and  
simulation concepts that  
are not covered in other  
texts, such as the  
Jackknife, bootstrap  
methods, the EM  
algorithms, and Markov  
chain Monte Carlo (MCMC)

methods such as the  
Metropolis algorithm,  
Metropolis-Hastings  
algorithm and the Gibbs  
sampler. By combining  
the discussion on the  
theory of statistics with a  
wealth of real-world  
applications, the book  
helps students to  
approach statistical  
problem solving in a

logical manner. This book provides a step-by-step procedure to solve real problems, making the topic more accessible. It includes goodness of fit methods to identify the probability distribution that characterizes the probabilistic behavior or a given set of data. Exercises as well as practical, real-world chapter projects are included, and each chapter has an optional section on using Minitab, SPSS and SAS commands. The text also boasts a wide array of coverage of

ANOVA, nonparametric, MCMC, Bayesian and empirical methods; solutions to selected problems; data sets; and an image bank for students. Advanced undergraduate and graduate students taking a one or two semester mathematical statistics course will find this book extremely useful in their studies. Step-by-step procedure to solve real problems, making the topic more accessible. Exercises blend theory and modern applications. Practical, real-world

chapter projects. Provides an optional section in each chapter on using Minitab, SPSS and SAS commands. Wide array of coverage of ANOVA, Nonparametric, MCMC, Bayesian and empirical methods.
