Otfried Perschke ist bekannt – ja berühmt – ob seiner Vielseitigkeit: Manuelle Medizin, Neuraltherapie, Akupunktur. Er ist ein Meister, wie es nur wenige gibt. So ist für ihn das Einbeziehen der traditionellen indischen Chakrenlehre in seine Therapiekonzepte die Krönung seiner 60 jährigen therapeutischen Erfahrung. Sein Ausspruch: „Der Weg zu den Chakren führt über die Akupunktur“ stellt vor Augen, dass die Synthese der verschiedenen energetischen Methoden aus unterschiedlichen Kulturen und Erfahrungen heute fällig ist und neue therapeutische Türen öffnet. Perschke hat die Fähigkeit, mit mystischer Esoterik vermengte medizinische Bereiche der unkonventionellen Verfahren durch die klare Sicht und Didaktik wieder auf seriösen Boden zu stellen und als eine praktikable Therapie nahe zu bringen. The use of complementary therapies is exploding, increasing the pressure to establish a rigorous science to support its practice. *Clinical Research in Complementary Therapies: Principles, Problems and Solutions* provides students with the tools they need to research complementary and integrative medicine (CIM) and so fill this gap. Essential for both undergraduate and postgraduate students, this second edition is significantly updated and enhanced. Part 1 deals with research strategies and methods, explaining the major types of clinical research in CIM and how these inter-relate. New chapters are included on whole systems research, qualitative

research and questionnaire development. Not all therapies can be treated the same way nor channeled through the signal process of randomized controlled trials. Therefore, detailed description of mixed methods approaches including observational, qualitative, cost-benefit and comparative effectiveness research are described. Part 2 deals with specific complementary therapies and how they are investigated by experts in each field. The book analyses the key questions asked and the controversies debated in complementary medicine research and offers clear and innovative guidance for answering these questions. **FEATURES** • Provides an overarching synthesis of methods in CIM and how they are to be used collectively including the role of comparative effectiveness research • Suggests both general and specific factors which need to be considered in assessing or planning complementary therapy research • Pinpoints aspects of research which are different in orthodox research and complementary therapy research • Reviews the types of research carried out in specific complementary therapies and analyses issues which arise • Includes

information on measuring the economic cost and benefits of complementary medicine, clinical audit and the role of placebos use • Builds upon recent research results, looks at the lessons these provide for all complementary therapies and suggests key issues to address in future research. • Provides an overarching synthesis of methods in CIM and how they are to be used collectively including the role of comparative effectiveness research • Suggests both general and specific factors which need to be considered in assessing or planning complementary therapy research • Pinpoints aspects of research which are different in orthodox research and complementary therapy research • Reviews the types of research carried out in specific complementary therapies and analyses issues which arise • Includes information on measuring the economic cost and benefits of complementary medicine, clinical audit and the role of placebos use • Builds upon recent research results, looks at the lessons these provide for all complementary therapies and suggests key issues to address in future research.

The workings of the suitable environment for cells—called the extracellular matrix

(ECM) and ground regulation—has occupied the European medical tradition since the early part of the 20th century. As it has become more clear that the origin of disease and its first signals register in the connective tissue, or myofascia, cellular pathologists and biochemists have sought to circumscribe networks of cell communication and microcirculation in the ECM. Alfred Pischinger (1899-1982) continued this line of work by further studying, in work published from 1926 through the late seventies, the connections of the ECM to the hormonal and autonomic systems. In the last twenty years Professor and Doctor of Natural Sciences Hartmut Heine and his colleagues have carried on Pischinger's work, here summarized in one volume. Part One encompasses theoretical underpinnings; Parts Two and Three address applications and directions for further research. This updated English-language translation not only is an account of the work of Pischinger's successors—Heine, Otto Bergsmann, and Felix Perger, (the three editors of this volume) and their many colleagues—but notes the positive development of

complementary therapies based on this understanding of histology. Acupuncture is referenced directly. Both in Europe and the States the work of manual therapists, including Rolfers, cranio-sacral therapists, and other somatic disciplines have been informed for many years by Pischinger's outsider model of how changes in the EMC register in the central nervous system and the brain, and are conveyed back to the periphery and connected organs. Heine's exciting recent work shows that the regulation and construction of the ECM have relationships to cybernetic non-linear systems and phase transitions.
